

## Onboard cleaning installation, Nyon

### INTRODUCTION

The city of Nyon in Switzerland, as part of a systematic campaign to clean tags on public buildings, mandated us to design and implement a complete cleaning system adapted and inserted into their service vehicle.

### PRESENTATION

This installation is made up of **high pressure cold water** cleaner and our stripping machine **LOKI 800**. The equipment is disposed on a stainless steel frame and can therefore easily be removed from the vehicle for easy maintenance. The onboard system allows easy and quick reaction all over the city territory and all kind of cleaning and stripping work. Our machine gives the operator an opportunity to unreachable finesse with a normal high pressure system. It allows among others to clean tags on different surfaces without altering the support.

### CALCIUM CARBONATE – ENVIRONMENT FRIENDLY

The use of calcium carbonate enables the operator to work in safe conditions. Calcium carbonate has the great advantage of presenting no danger to environment or users, while still having good abrasiveness. The user equipment is also reduced and much less constraining. Only the wearing of masks, goggles, hearing protection and gloves are required making it more comfortable to the user.

Present in various forms it allows a fairly wide range of cleaning jobs, from removal of a tag on a window (MS-140) to stripping of metal barriers or structures (MP-800).
